

Application: Renson Link

1 RELEASE NOTES – VERSION 1.0

- Install the application on a Windows 10 computer
- Configure the WiFi connection of the Renson Sense device
- Store the Wifi SSID and credentials
- Configure the following device settings for one or more devices simultaneously, once connected to Wifi:
 - LED interval
 - LED brightness
 - Sensor selection
 - CO2 thresholds
- Add one or more devices to your My Lio account
- See an overview of all devices in your account and/or the local network
- Filter the overview or search for a device

2 KNOWN ISSUES

- If you are automatically logged out due to the expiration of your login token, it is not possible to log back in after entering your email address unless you close and restart the application
- Renson Link only scans on the main network and not on other (WiFi adapters). Suppose your laptop is connected via cable but also via WiFi on another network, then only the wired network is scanned, disconnect your wired connection to scan the local WiFi network.
- When a device is linked with My Lio but is no longer online, in some cases the status will still remain online.
- If no network is available, there is no timeout to finish scanning. You will need to force and restart the application
